About this extension

Wikipedia keeps track of official URLs for popular websites. With DNS over Wikipedia installed, domains ending with `.idk` are resolved by searching Wikipedia and extracting the relevant URL from the infobox.

Example:
1. Type `scihub.idk` in browser address bar
2. Observe redirect to `https://sci-hub.tw`

Written by Aaron Janse and Vihan Bhargava.

Permissions   [Learn more](#)

This add-on needs to:

Access your data for sites in
the idk domain

Access your data for
en.wikipedia.org
